Yunhan Li

Pittsburgh, PA | yunhanli@andrew.cmu.edu | linkedin.com/in/yunhan-li-403259140

EDUCATION

Carnegie Mellon University, School of Computer Science — Pittsburgh, PA
Master of Software Engineering — Aug 2026 – May 2028
Coursework: Machine Learning in Production, Formal Methods, Requirements for Information Systems

Drexel University — Philadelphia, PA
Bachelor of Science in Computer Science — Sep 2013 – Sep 2017

EXPERIENCE

Peking University Software Engineering Co., Ltd — Beijing, China
Front-end Lead — 2021 – Aug 2026
Frontend Developer — May 2019 – 2021
Frontend technical lead for a 3-person team within a ~25-person cross-functional product group.

- Led frontend productization for a new enterprise SAST platform, turning source-code and binary analysis engines into configurable workflows for developers, security teams, and engineering leaders.
- Designed rule and detector workflows for conventional and LLM-assisted analysis, covering CWE/OWASP mappings, severity policies, custom vulnerability definitions, and AI-generated remediation; prioritized bulk false-positive handling because noise, not missed findings, is what makes teams turn a scanner off.
- Co-defined requirements and modules for a software supply chain monitoring platform, including layered asset discovery across hardware, software services, and code repositories, event-driven scans, incremental analysis, CVE-to-asset correlation, and multi-channel alerts.
- Translated interactive call-graph requirements into caching, persistence, and data-model decisions so large dependency graphs could be explored in a multi-user web application.
- Adapted product workflows for centralized governance, audit and approval processes, single sign-on, and integration with other developer tools across different customer environments.
- Migrated the frontend from jQuery to React and Vite, introduced a low-coupling component architecture, and automated build, packaging, and nginx/IIS publishing, cutting deployment from 3–5 minutes of manual RDP work to 20–30 seconds with one command.
- Took ownership of requirements and scope for two later products, a code-change impact analysis tool and an artifact repository platform, while continuing to own frontend implementation and delivery.

CG Max Design Corp — Remote (Philadelphia, PA)
Web Software Developer — Jan 2018 – Sep 2018

- Supported website and internal-tool upgrades during a platform migration using JavaScript, jQuery, and CSS.

PROJECTS

LAN Remote Desktop & Screen Streaming | Personal project — 2023

- Designed a zero-install, browser-based LAN remote desktop after benchmarking OBS (~300 ms) and packaged alternatives against three requirements: low latency, cross-platform access, and flexible input remapping.
- Built a React client, Node.js/WebSocket streaming service, Java input-control service using Robot, and ffmpeg capture pipeline behind a single launcher, reaching ~100 ms latency with ~20 custom key-mapping profiles.

Aeon Cymatic | Browser-based music production toolkit — 2025 – Present

- Unified three tools spanning successive stages of writing music — a piano-roll sketchpad, a probabilistic drum-beat generator, and a real-time spectrum analyzer — into one React/TypeScript application on Node.js and SQLite, so trying any of them needs no install and no desktop audio workstation.
- Self-hosted and running for about a year; also built an Ableton Live device that generates melodies from variable-order Markov models trained on the clips already open in the session.

Relationship Management System | Personal project — 2026 – Present

- Models relationship state and next actions rather than contact records, with a locally hosted LLM parsing captured profiles and drafting outreach; asynchronous processing keeps slow model calls off the request path. React, TypeScript, Node.js, Drizzle ORM, SQLite.

SKILLS

- **Languages:** TypeScript/JavaScript, Python, Java, C#, SQL, HTML/CSS
- **Frontend:** React, Vue, Vite, Ant Design, ECharts, AntV (G6, F2), component architecture
- **Backend & Data:** Node.js, Express, SQLite
- **Build & Delivery:** Build and release automation, Vite, npm scripting, nginx, IIS
- **Product Engineering:** Developer tools, SAST/SCA workflows, requirements definition, technical documentation
